ABSTRACT

India's education sector has greatly benefited from privatized in order to meet the nation's growing demand for public education. The term "privatisation of education" refers to the transfer of the administration of education from public to private providers, with the overarching goals of (I) Increasing access to and support for elementary schooling and education, (ii) Improving learning outcomes and overall effectiveness, and (iii) Increasing value in educational opportunities. By focusing on the overall progress of the student, school education plays a key role in determining the future of the nation. Its worries are also accompanied by consideration of the increasing importance and rapid growth of various tuition-based private schools as well as the commitments they make to society. Examining the privatizing trend and its issues is important from a practical perspective as well. In light of this, the current research aims to analyse the problems and opportunities of privatized school instruction from the perspectives of parents, teachers, and students with special reference to India.
