ABSTRACT

As today's learners belong to the Digital Age and are techno-savvy, English faculty also must adapt to use technology and multi-media based learning resources to impart the functional learning of English. So the need of the hour is to develop a common preservation infrastructure to preserve language-rich web contents, research data, publications, dissertations and other online assets. If a collection of such data in the form of digital objects are preserved and a proper information retrieval mechanism is provided to access those data then every learner regardless of their skill level and background can access the online and offline contents available, quickly and efficiently.

KEYWORDS : English Teaching, Technology Improvement, Innovation in English.
