ABSTRACT

Researchers and engineers are making efforts to design and implement a high secure, efficient and reliable network for next generation. One of the efforts that are well known in this direction is known as MANET (mobile ad hoc network). MANET is much popular and area of interest for researchers due to their ad hoc nature and self-organizing capability. But this nature of network produces or introduces some security issues. In this paper we provide a brief analysis and behavior of the different security issues and their properties. Additionally we provide the main source where these problems are arises.

KEYWORDS: Properties, Effects, *MANET*, Security, Ad Hoc Nature
