ABSTRACT

A non-descript female calf of about 4 month age with 30 kg body weight was affected with winter coccidiosis at Institute's Integrated Farming System Research Unit in the month of January 2015. After 4 days treatment with coccidiostat and fluid therapy the calf recovered gradually and started normal feeding on 7th day onwards. Colostrum feeding in early age and hygiene and sanitation in calf shed may prevent coccidiosis in calves.
