ABSTRACT

Using quantum entanglement, quantum zeno effect and dark energy we can build amazing instruments in the future instantaneous like communication, time machine etc.

Dark energy: whenever some objects feels gravity, it curves the space-time, space-time becomes like a bowl shaped pit below the object. But in the environment of dark energy a object always feel anti-gravity forces, so then there is a bump in space-time underneath the object, if that object has any velocity that must be negative velocity as space-time curvature at that time is just opposite the case where the object feels the gravity not antigravity, so if it (object in antigravity) has a velocity it must be negative velocity, because situation where object feels antigravity its velocity is negative as situation is opposite of gravity induced situation. If we attain velocity magnitude C (Velocity of light) with positive velocity and continue for one week, after that will go into the future 100 years ahead of the time from when we started, for example. With negative velocity in similar fashion we can go 100 years back into the past. So if we find a path in universe through dark energy, and if an object proceeds with negative velocity with magnitude C through that path, that object can reach past in that manner. So this way time travel to past is possible in this way.

KEYWORDS: Faster than Light, Time Travel
