ABSTRACT

Tumor is a disease that involves abnormal growth with the potential to invade or spread to other parts of the body. Not all tumors are cancerous; tumors do not spread to other parts of the body. Possible signs and symptoms include: a new lump, abnormal bleeding, a prolonged cough, unexplained weight loss, and a change in bowel movements among others. While these symptoms may indicate cancer, they may also occur due to other issues. There are over 100 different known cancers that affect humans
